

Medication non-adherence undermines your patient treatment goals

And is 100% preventable

The problem:

31%

of prescriptions go unfilled because of cost concerns, uncertainty, and confusion.

60%

of patients forget the medication instructions immediately upon leaving the doctor's office.

75%

of patients don't take medications as prescribed.

85%

of prescriptions are not refilled as prescribed.

The solution:

Make a Compounding Pharmacist a member of the treatment team

1) The prescriber/pharmacist consult

Confirm medicines to be included, the unique dosage, and the form of delivery to achieve treatment outcomes. (No prescription handed off to the patient or simply called in and left up to the patient to fill)

2) The pharmacist guides the patient to complete the treatment regime

- Reaches out to the patient to fill the prescription order
- Provides robust education and support, answers questions and concerns
- Helps patients obtain insurance coverage or access care for the uninsured
- Conducts care calls and refill support
- Reports to the prescriber when non-compliant for follow-up
